Company: NovaScale Technologies
Job Title: Senior Backend Engineer

About NovaScale Technologies:
NovaScale builds mission-critical high-throughput microservices for modern enterprise systems.

Responsibilities:
- Design and implement scalable services that communicate over HTTP using REST APIs and gRPC.
- Work with relational data and write complex queries against PostgreSQL databases.
- Investigate algorithmic complexity and optimize critical database queries for high concurrency.
- Build and maintain CI/CD pipelines and automated testing suites.

Minimum Qualifications (Required):
- 4+ years of professional backend software development experience.
- High proficiency with Python or Go.
- Strong understanding of Data Structures & Algorithms and Big-O computational complexity.
- Solid grounding in Object-Oriented Design and design patterns.
- Experience with relational databases, SQL indexing, and schema design.
- Experience with Docker containerization and AWS infrastructure.
- Strong problem solving aptitude and collaborative team communication.

Preferred Qualifications (Bonus):
- Hands-on experience with Kubernetes orchestration.
- Experience training machine learning models or building predictive pipelines.
- Familiarity with Linux kernel concepts, process memory, and multithreading.
- Experience with Redis caching and Apache Kafka event-driven architectures.
